

[B] Compounds containing Two or more similar functional group!

When the compound contains two or more similar functional groups, the term -di-, -tri- etc are added before the suffix or prefix of the functional group. While doing so, the terminal 'e' of the parent alkane is retained. For example.

Pentane-2,4-diol

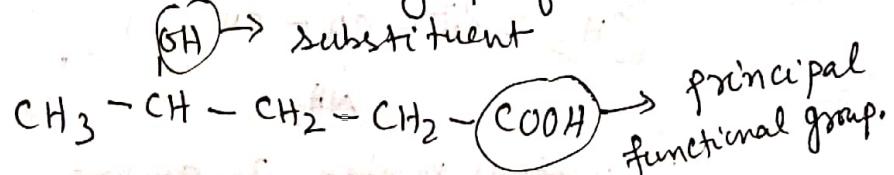

Butane-1,4-dicarboxylic acid

[C] Compounds containing Two or more different functional group!

A compound is said to be polyfunctional compound if it contains more than one functional group. The multiple bond ($\text{C}=\text{C}$) or ($\text{C}\equiv\text{C}$) is also considered as a functional group. In IUPAC system, one of the functional group is chosen as the principal functional group (secondary suffix) and the remaining functional groups (secondary functional groups) are treated as substituents and indicates by prefixes.

For example:-

The $-\text{COOH}$ group is the principal functional group, while $-\text{OH}$ group is a substituent.

The principal functional group is mentioned with the suffix name while secondary functional groups are mentioned only with their prefix name.

The choice of the principal functional group is made on the basis of the following order of preference:

carboxylic acid > sulphonic acid > acid anhydrides > esters
 > and halides > and amides > cyanides > aldehydes >
 Ketone > alcohol, phenols, thiols > amines > ether > alkene >
 alkyne.

Akyl ($R-$), Cl, Br, F, NO_2 etc are prefix substituents.

The order of seniority among the principal group is given according to the following table along with their prefix and suffix names. The functional group which occurs higher up in the table is the principal functional group.

Seniority Table for principal groups. (Highest priority)

Group at the Top.)

Group	prefix name	suffix name
$-\text{COOH}$	carboxy-	-oic acid.
$-\text{SO}_3\text{H}$	sulpho-	-sulphonic acid.
$-\text{COOR}$	Alkoxy carbonyl-	-alkyl oate.
$-\text{COX}$	Halo formyl-	-oxy halide.
$-\text{CONH}_2$	Carboxoyl -	-amide
$-\text{C}\equiv\text{N}$	Cyano -	-nitrile
$-\text{NC}$	isocyano -	-carbyl amine
$-\text{CHO}$	Formyl -	-al
$\text{C}=\text{O}$	Keto- or oxo -	-one
$-\text{OH}$	Hydroxy -	-ol
$-\text{NH}_2$	Amino -	-amine
$-\text{OR}$	Alkoxy -	-
$>\text{C}=\text{C}<$	-	-ene
$-\text{C}\equiv\text{C}-$	-	-yne

Group	Prefix name.	Suffix name
-NO ₂	nitro -	-o-
-NO	nitroso -	-ono-
-X	Halo - (Fluor-, chloro-, Bromo-, Iodo-)	-o-

1. The first step in the naming of poly-functional compounds is the selection of principal functional group. The principal functional group gives the class name of the structure.

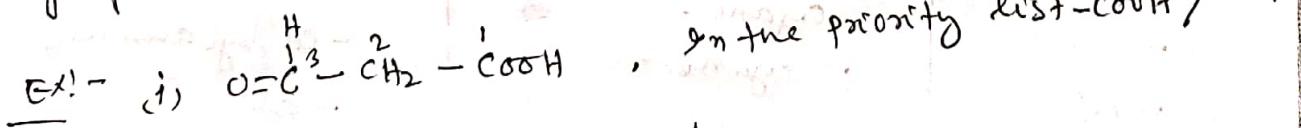

2. The second step is the selection of parent chain. The parent chain is so selected that it includes the maximum number of functional groups including the principal group.

3. The third step is the numbering of parent chain. The parent chain is numbered from the side of principal functional group, i.e. it gets lowest numbers.

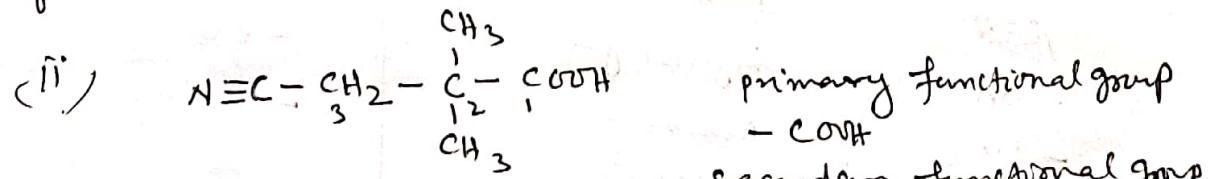

The following decreasing order of preference for giving the lowest numbers is followed.

principal functional group > double bond or triple bond > substituent

4. Substituents, side chain and secondary functional groups are named in alphabetical order.

3 - formyl propanoic acid.

secondary functional group
- C≡N

3 - cyano - 2,2-dimethyl propanoic acid.

3 - cyano - 2,2-dimethyl propanoic acid.

Writing The Structural Formula From The Given IUPAC.

Name:-

The IUPAC name of an organic compound consists two, three or all the following parts.

- a) Root word
- b) primary suffix
- c) Secondary suffix
- d) prefixes.

a) Root word:-

Root word indicates the longest carbon chain. Thus the first step is to locate the longest chain from the root word. Write the number of carbon atoms in a straight chain and number them from one end.

b) primary suffix:-

Primary suffix (-ane, -ene, or -yne) indicates the nature of the chain. In case multiple bonds are present, place them at proper places in the chain and rest by single bonds.

c) Secondary suffix:-

Secondary suffix indicates the principle functional group. place it at proper place in the chain. ~~terminating group, put~~ In case the principal functional group is the chain terminating group, put it at carbon-1. (If the functional group does not carry any numerical number, it is assumed that it is located at carbon-1).

d) prefixes:

prefixes are the substituents or secondary functional groups. place them at the proper places with the help of locants.

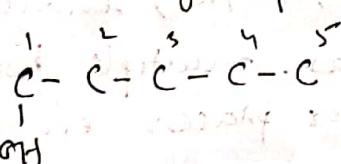

e) Skeleton formula is obtained by considering the above steps. Now add hydrogen atoms to satisfy four valencies of each carbon atom to get the structural formula.

Ex-1 Write the structural formula of branched 2-methylpentan-1-ol.

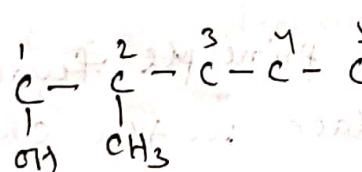

Here, Root word - pent, primary suffix - ane
Thus the carbon consists five carbon atom, all linked by single bond

functional group = ol = $-\text{OH}$ at carbon-1

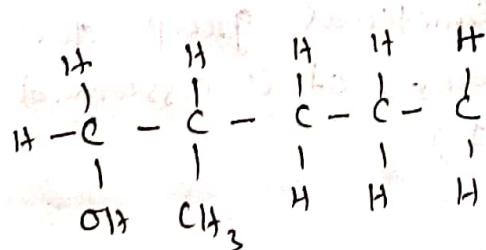

substituent = methyl group at carbon-2

Satisfying four valencies of carbon atom, the

structural formula is obtained as

Ex-2

Write the structure of 3-chloro-5-hydroxyhex-3-enal

Aus:-

root word = hex

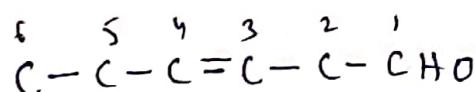

thus, the chain consists six carbon atoms,

functional group = 3-enal

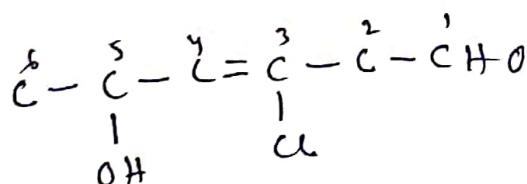

and

the primary functional group = 1-al

Substituents = 3-chloro

secondary functional group = 5-hydroxy

Satisfying four valencies of carbon atoms, the structural formula obtained is
